Before you start

Provision an Azure Storage account

Explore blob storage

Explore Azure Data Lake Storage Gen2

Explore Azure Files

Explore Azure Tables

Explore blob storage

Now that you have an Azure Storage account, you can create a container for blob data.

1. Download the `product1.json` JSON file from <https://aka.ms/product1.json> and save it on your computer (you can save it in any folder - you'll upload it to blob storage later).

*If the JSON file is displayed in your browser, save the page as **product1.json**.*

2. In the Azure portal page for your storage container, on the left side, in the **Data storage** section, select **Containers**.
3. In the **Containers** page, select **+ Container** and add a new container named **data** with a public access level of **Private (no anonymous access)**.
4. When the **data** container has been created, verify that it's listed in the **Containers** page.
5. In the pane on the left side, in the top section, select **Storage browser**. This page provides a browser-based interface that you can use to work with the data in your storage account.
6. In the storage browser page, select **Blob containers** and verify that your **data** container is listed.
7. Select the **data** container, and note that it's empty.
8. Select **+ Add Directory** and read the information about folders before creating a new directory named **products**.
9. In storage browser, verify that the current view shows the contents of the **products** folder you just created - observe that the "breadcrumbs" at the top of the page reflect the path **Blob containers > data > products**.
10. In the breadcrumbs, select **data** to switch to the **data** container, and note that it does not contain a folder named **products**.
